

Tabakismus pupils at sixth classes in selected primary schools in

Litvinov

ABSTRACT:

The aim of this work is focused on the tobacco problems at pupils in 6th grade in primary schools in Litvinov. I'll try to find out if the number of this pupils who use tobacco products is alarming or if it is only in some cases. I focused on this age group because the puberty starts and also they come from first level to second level in primary schools. This work will be focused on how can these teenagers reach cigarettes, if there is an influence from Litvinov, where they live and meet their freinds, school, which they visit or from parents. The research will be conducted by the surveys. The researches on children and adolescents from a sphere of tabakism precede this survey, also a psychosomatic development and a prevention of this socially pathological behavior in primary schools.
