The extent of awareness of pubescents and adolescents before a planned operation

The theoretical part of this work deals mainly with the mental preparation of adolescent patients before a planned operating surgery (operation).

I used two kinds of anonymous non-standardize questionnaires for the research, one of them was used for collecting of data from nurses and the other was used for collecting data from adolescent patients. The research was carried out from November 2005 to March 2006. It surveyed the extent of contentment of adolescent patients and nurses with the information provided at selected workplaces before a planned operation. The results of the research show rather high contentment of nurses and adolescent patients with the information provided before a planned operating surgery (operation) at selected workplaces and the independence of contentment on the age, sex and earlier experience of adolescents with a planned operation.
