Defended in:	2014
Key words:	awareness, cervical cancer, HPV infection

This bachelor thesis deals with the awareness of girls aged 13 to 14 years and their mothers on the prevention of cervical cancer.

The theoretical part deals with awareness in terms of health literacy such as reproductive health education, prevention of cervical cancer, especially vaccination against HPV infection and the importance of regular gynaecological examinations. It also briefly describes the current situation of cervical cancer incidence, clinical presentation, diagnostics, treatment and consequences of the disease.

The empirical part investigates the knowledge of girls and mothers with regards to this thesis by identifying and compares the information of the selected group (girls 13 – 14 and their mothers) on the issue of cervical cancer, risk factors of the cancer and prevention, such as vaccination and regular preventive gynaecological examinations.

I have used a qualitative research approach using a questionnaire. The results are presented in the form of tables and graphs. As a result of this thesis an educational program for girls will be created.
