

The intention of this work is to construct and present general ambit of running of water management and water management policy between years 1870-1928, specifically in the Czech territory (Czech country). By researching this problem I am going to present the field of Water Management at that time like a new, progressive and ground-breaking aspect of agricultural policy of Austria-Hungary and its countries, which was understood as a tool for modernization with far-reaching effect on agricultural policy. This approach also started the new era of agricultural use of water. In the second part of this work I want to present on the example of Rakovník stream the development of using the water in the water management, which preceded 1870 and on this same example I am going to focus on practical results of the new water management policy which were presented in the first part of the work, in years 1870-1928.
