PRESL, Ale: Comparison of selected match performance parametres performances in modified forms of football. [Diploma thesis]. Charles Univerzity in Prague. Faculty of Physical Education and Sport. Department of Sports games. Supervisor: Phdr. Mario Buzek, CSc. Prague: FTVS UK, 2015.

Abstract

Title: Comparison of selected mach performance parametres in modified of fotball

Objectives: The main target of the thesis is to compare and analyse match parameters in different age categories in football, mainly U8, U10 and U12 at various match performances during the game. The selected categories play various game systems. U8 4+1, U10 5+1, U12 7+1. The thesis at the same time focuses on the difference in IMP (Individual Match Performance) and its comparasion.

Methods: The method of observation and analysing partial components is used in the thesis. The observation was mainly focused on the selection of younger age categories in which the development of football skills is on its top. For these categories I have collected crucial and essential information and data, the outcomes were further statistically evaluated. I have applied the method of analysing in the breakdown of particular disciplines and further provide a comparison of the selected match parameters.

Results: The statistically evaluated game parameters (all but one), which we have investigated and compared, proved correct the given scientific question. The size of the field and number of players has its adequate reasons in the development of the youth categories. The amount of shooting opportunities in addition to the size of the field and beginning game tactics decrease at the expense of habits learned in former categories and smaller field sizes.

Keywords: Modified forms, match performance, skills, performances (values), field size, individual match skills, individual match performances,
