

Abstract:

This work examines the influence of asthma on children's sports activity. Tested were nine children with asthma bronchiale, athletes and non-sportspeople, using a test battery UNIFITTEST (6-60). The work compares the results of the children tested with results that indicate standardized tables for children of the same age. It explores whether the results will vary greatly and will be the same. The information obtained was processed into tables.

Keywords:

Asthma bronchiale, sport activities
