

Příloha č.1 – doplňující obrázky

Obrázek 1: Pokus č. 1- pohled do experimentálního foliového tunelu těsně před sklizením pokusu.

Obrázek 2: Podíly mrtvých ramet v různých množstvích hnojiva pro spojené (zeleně) a nespojené (žlutě) ramety. Na bázi sloupečků je celkový počet ramet v dané kategorii.

Obrázek 3: Biomasy spojených ramet v jednotlivých treatmentech a nespojených ramet s odpovídajícím množstvím hnojiva. Šířka boxplotů proporčně odpovídá počtu pozorování v kategorii. Průměrná biomasa a medián biomasy nespojených ramet mohou být vychýlené kvůli nerovnoměrnému přežívání méně a víc hnojených ramet v dané kategorii.

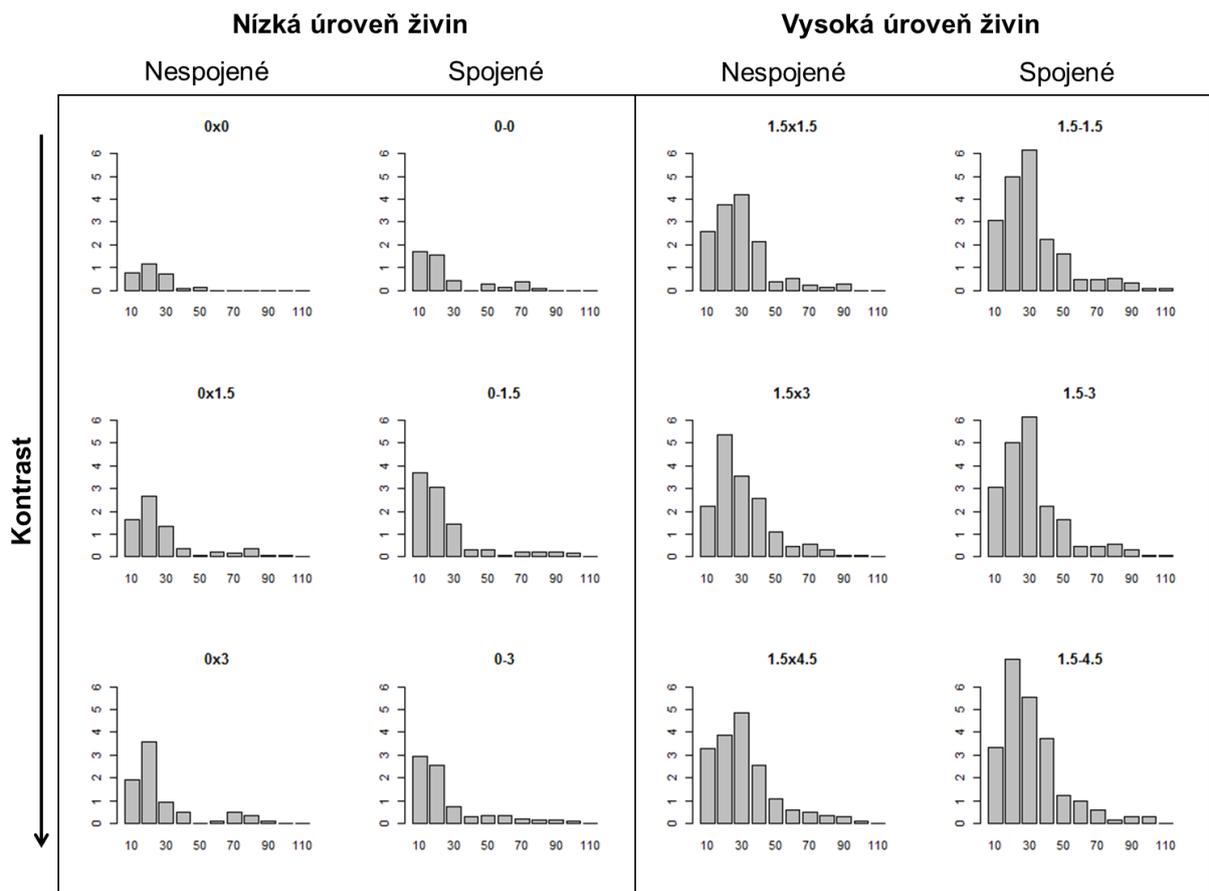

Obrázek 4: Klonální fragment před zasazením do experimentálních podmínek na začátku pokusu č.2.

Obrázek 5: Pokus č.3 – pohled do experimentálního foliového tunelu.

Obrázek 6: Dvojice mateřské (vpravo) a dceřiné (vlevo) ramety v nehnojených podmínkách v pokusu č.3.

Obrázek 7: Zastoupení různých délek šlahounů u dceřiných ramet v jednotlivých treatmentech v pokusu č.3.

Příloha č.2 – detaily modelů

Pokus č.1

Význam jmen proměnných v modelech

biomasa – biomasa ramet v gramech

biomasa.dv – biomasa dvojice ramet v gramech

doba_kor – počet dní od doby sklizení nadzemní biomasy po promytí kořenů

hnojivo – množství hnojiva dané ramety v gramech

klon – příslušnost ke klonu, faktor se třemi hladinami: A (klon A), B (klon B) a C (klon C)

klon2 – příslušnost ke klonu, faktor s dvěma hladinami: A (klon A), BC (klony B a C)

kontrast – rozdíl v hnojení dvojice ramet, faktor se čtyřmi hladinami: 0 (rozdíl 0 g), L (rozdíl 1 g), M (rozdíl 2 g) a H (rozdíl 4 g)

level – průměrné množství hnojiva dvojice ramet v gramech

mort – podíl mrtvých ramet z dvojice ramet, nabývá hodnot 0 (obě živé), 0,5 (jedna mrtvá) a 1 (obě mrtvé)

od.rohu – vzdálenost od rohu skleníku s úživnější půdou

orientace – umístění ramety na původním šlahounu, faktor se dvěma hladinami: A (apikální rameta) a B (bazální rameta)

poc.dv – součet počátečních velikostí (počtu listů) dvojice ramet

pocatek – počáteční velikost ramety (jako počet listů)

smrt – údaj o smrti ramety, faktor se dvěma hladinami: 0 (živá rameta) a 1 (mrtvá rameta)

spojeni – údaj o spojení mezi rametami, faktor se dvěma hladinami: ano (spojené ramety) a ne (nespojené ramety)

trat – kombinace úrovně živin a kontrastu mezi rametami, faktor s dvanácti hladinami, první dvě písmena v názvu hladiny kódují úroveň živin (ll – nízká úroveň, ml – střední úroveň, hl – vysoká úroveň), poslední dvě písmena kódují kontrast mezi rametami (nc – bez kontrastu, lc – nízký kontrast, mc – střední kontrast, hc – vysoký kontrast)

Model 1.0: Porovnání variability vysvětlené faktorem klon před a po sloučení klonů B a C

Biomasa apikálních ramet:

Pokus č.2

Význam jmen proměnných v modelech

biomasa – biomasa ramet v gramech

biomasa.baz – biomasa bazální ramety z dvojice v gramech

biomasa.dv – součet biomas ramet ve dvojici v gramech

hnoj.ap – množství hnojiva apikální ramety z dvojice v gramech

hnojivo – množství hnojiva v gramech

orientace – umístění ramety na původním šlahounu, apikální nebo bazální

poc.baz – počáteční velikost bazální ramety z dvojice (jako celková délka šlahounů)

poc.dv – součet počátečních velikostí dvojice ramet

pocatek – počáteční velikost ramet měřená jako celková délka všech šlahounů

RS.baz – poměr podzemní a nadzemní biomasy bazální ramety ze dvojice

rutysuty – poměr podzemní a nadzemní biomasy ramet

spojeni – údaj o spojení mezi rametami, faktor se dvěma hladinami: „ano“ (spojené ramety) a „ne“ (nespojené ramety)

treatment4 – údaj o treatmentu, faktor se 3 hladinami: „0-3“, „0 a“ a „0-0“, u faktoru jsou upravené kontrasty (viz modely 2.4 a 2.5)

Model 2.1: Vliv hnojiva na biomasu nespojených ramet

Pokus č.3

Význam jmen proměnných v modelech

biomasa – biomasa ramet v gramech

hnojivo – množství hnojiva v gramech

hnojivo_druha – množství hnojiva druhé ramety z dvojice v gramech

kontrast – velikost kontrastu v množství hnojiva mezi mateřskou a dceřinou rametou, uspořádaný faktor se 3 hladinami: „0“, „1.5“ a „3“

level – úroveň živin dceřiné ramety, faktor se dvěma hladinami: „0“ a „1.5“

matky_pocatek – počáteční velikost mateřských ramet jako celková délka šlahounů

RS – poměr podzemní a nadzemní biomasy ramet

spojeni – údaj o spojení mezi rametami, faktor se dvěma hladinami: „ano“ (spojené ramety) a „ne“ (nespojené ramety)

zahaj_celkem – celková délka šlahounů mateřské ramety v okamžiku přerušení spojení mezi mateřskými a dceřinými rametami u nespojených ramet

zahaj_max – délka šlahounu, ze kterého vznikla dceřiná rameta v den zakořeňování dceřiných ramet

Model 3.1: Vliv hnojiva na biomasu nespojených mateřských ramet

Morfologie

Význam jmen proměnných v modelech

g_cm – hmotnost jednotkové délky šlahounu, tj. nadzemní biomasa dělená celkovou délkou šlahounu

hnojivo – množství hnojiva dané ramety v gramech

hnojivo2 – údaj o hnojení dané ramety se dvěma možnými hodnotami: „0“ (nehnojená) a „1“ (hnojená)

ks – počet šlahounů dané ramety

max – délka nejdelšího šlahounu v centimetrech

slah_g – biomasa nadzemní části ramety v gramech

spojeni – údaj o spojení mezi rametami, faktor se dvěma hladinami: ano (spojené ramety) a ne (nespojené ramety)

Model 4.1: Nejdelší šlahoun u mateřských ramet

```
Call: lm(formula = log10(max) ~ log10(slah_g) * hnojivo2,
data = matky[-70,])
```
