

Abstract

The paper examines the suitability of municipal waste landfill in the Czech Republic. Landfill is still the most common method of waste disposal. This is mainly due to the number of landfills in the country, the level of charges, poorly built infrastructure capacity and other technical facilities for waste management. The work deals with the actual construction of landfill, through the production, collection and sorting MSW to the political and economic waste management. It also focusing on current issues of legislation and waste management. Part of this work is survey of public opinion and professional's views on this issue, which is divided to supporters and opponents. Although the landfill has still a decreasing trend, the fact remains that there will be always stay some residual waste that can not to be completely remove. So the landfill will always remain as integral part of waste management.
