

Abstract

Name:

Complex evaluation of the basic school ski courses in the Czech republic

Objective:

The objective of this diploma thesis is to evaluate complexly a chosen basic school ski school courses in the Czech republic according to five above mentioned criteria and to confirm or dismiss hypothesises.

Methodology:

I created a non-standardized questionnaire with open-ended, semi close-ended and close-ended questions to evaluate ski courses according to the above mentioned criteria. This questionnaire was sended non-anonymously online via survio.com to randomly chosen basic schools in every single province of the Czech republic. Collected data were statistically analysed in the Survio and Microsoft EXCEL[®] programm and the results were eriched with graphs and commentary.

Results:

In this diploma thesis basic school ski courses were evaluated according to determined criteria, at least one hypothesis was related to every criterion. I could confirm that the majority of ski course leaders are ski instructors (50 hours training, no trade licence). I could confirm four other hypothesises as well, i. e. cross-country skiing is an essential part of more than 50% ski courses, less than 50% of pupils attend basic school ski courses, the majority of ski course instructors are teaching in accordance with the methodology of the „Czech ski school“ and that the course fee is less than 5000 CZK pro person. On the other hand, two other hypothesises were not confirmed, because on the basis of the questionnaire snowboarding is an integrated part of more than 50% evaluated ski courses and not all student are obliged to use ski helmet.

Key words: ski course, skiing, cross-country skiing, snowboarding, basic school
