

## **Abstract**

The main objective of my thesis is a knowledge of social environment of prague district Karlín, one of the most dynamic part of inner Prague, which is undergoing a transformation of a physical, functional and social structure. The concept of social environment is used in this work, whereby the social environment is consisted of a social structure and a social climate of a locality. By an analyse of the social, physical and functional structure and a research of daily rhythms it tries to identify main pacemakers, to deeply learn about proceses and key moments during the day, which structured the locality, and to capture social groups of users of the locality.

The research is focused on three selected basic administrative units: ‘Karlín – západ’, ‘Rohanský ostrov’ and ‘Za Invalidovnou’. Each of these localities has its own daily rhythm, which is structured by the resident population and the temporarily present population, and different social environments, which influence each other, are dependent on each other and create the whole character of the prague district Karlín. The work tries to deepen and critically evaluate a current methodology.
