

Background: A school prevention worker (SPW) evaluates the Basic Preventive Programme (BPP) every academic year. The draft design of reporting system (RS) of preventive activities was created as a result of the VYNSPI project. Online RS was designed with the aim of uniting the form and providing schools with a (self-) evaluation tool.

Aims: The main aim of this thesis is the analysis of the feedback from SPW.

Research group: 60 respondents from elementary and high schools from four regions of the Czech Republic participated in the data collection (90% of the respondents were female). Average number of years in practice was 24,2 years and 76,6% of respondents have a specialized SPW education.

Methods: The feedback was collected via an on-line questionnaire. Results were evaluated by descriptive statistics in MS Excel.

Results: Reporting system feedback obtained from SPWs or other prevention workers came with a positive result. About 73% of respondents understood the used terminology and were satisfied with the graphical form of the RS. The final PDF output of RS in PDF format was considered as useful by 73% of respondents and 46,6% of respondents claimed they would use it as the basis for the final evaluation of the BPP at school. Respondents evaluated the online RS with the average mark of 1,64.

Conclusion: RS is evaluated by people from prevention practice as a useful tool for evaluation of preventive activities at schools. Wider implementation in practice is possible.
