

**Abstract:** Senior thesis “The development of electoral support of far-right parties in Slovakia during 2010-2016 and factors influencing this support” examines the development of electoral support of Slovak National Party and People’s Party Our Slovakia using some of the tools of electoral support geography. The theoretical part is dedicated to existing definitions of extreme right-wing parties through which the choice of parties for further examination is made. The analytical part is split into two parts: the first classifies electoral support through the method of region and core of electoral support. At the same time, the first part defines regions which have had a stable electoral support throughout the entire observed period. All findings are presented in a cartographic form. Using an array of statistical tools, the latter part takes on the task of correlating the results of elections, in regards to far-right parties, with selected demographic characteristics of municipalities, which are assumed to have positive impact upon the income of far-right parties.
