

Organization of individual league competitions in sport centres brings various difficulties. Players need to have access to their results and standings, organizers besides monitoring the league need to set the rules, evaluate the results and organize tournaments. The aim of this work is development of an application which would make such activity simpler. We bring adjustable system, where it is possible to manage a lot of leagues with different demands under one web application. It handles multiple sports, diverse match systems and specific rules of each league. It is built on ASP.NET platform using Model-View-Controller design pattern. We describe technologies and architecture for web development, and present our application using diagrams and screenshots.
