

Abstract

The work deals with molluscs as specific inhabitants of boulder sites in southern part of Křivoklátsko PLA. It discusses related questions and information sources connected with nature protection. The thesis describes molluscs as generally lesser known, but diverse group of animals with variety of ecological requirements. It shows the results of malacozoological site research performed using collection of leaf litter samples and compares them to previous works. It also examines how the topic could be incorporated in education. The work emphasizes the ecology of molluscs, whose knowledge can facilitate contextual thinking about various organisms and also is not confined to a narrow scope of biology. The thesis discusses various means of education and describes a general proposal of excursion to the place of interest.
