

ABSTRACT

The theoretical part of the thesis focuses on organic food and ecological agriculture problematics. The primary objective is to point out advantages and disadvantages of organic food and therefore, I mention comparison of organic and conventional food in the thesis. The practical part investigates attitudes and levels of knowledge of students of selected lyceums about organic food. The quantitative research (survey) was conducted at three lyceums in Prague. The statistical methods were used to verify the stated assumptions. While processing the survey I have learned that students struggle with the field of healthy nutrition than with the field of ecological agriculture and therefore, a proposal of healthy nutrition and organic food lecture has been chosen as the pedagogical output of the thesis. A tutoring presentation will focus on students of lyceums and its purpose will be to raise awareness about this problematic.
