

Abstract:

Title: Comparison of the game performance efficiency on the 2014 World Championship for woman in Turkey.

Objectives: Compare and describe the effectiveness of selected performance gaming indices in all matches played during the 2014 World Championship in Turkey. The partial aim of the thesis is to find out the relation of the game indicators and the result of the match, which has a difference of 10 or less points.

Methods: The main method is the secondary analysis of data that was obtained by direct observation during a match. These data are available to the public on the fiba.com web site in clear tables. Their values were analyzed and subsequently described and evaluated.

Results: Using quantitative data processing, we have confirmed the improved efficiency of winning cooperatives in most of the tracked gaming indicators. We also confirmed the inadequate interdependence between one game factor and the result in a match.

Keywords: team game performance, indicators, shooting, success, comparison, individual game activities, shooting success, rebounds
