

## **ABSTRACT**

The thesis is focused on identifying the basic assumptions for successful participation of Czech Football clubs in European competitions. One of the main motivations is the financial reward resulting from participation in European competitions. Basic assumptions are found in the team axis and their representative experience in team selection U16-U21, in the ideal age average of the basic assemblies, opponents' playability from the point of view of their nationality and an estimate of the progress of Czech teams in future years against teams by nationality. The results of the thesis clearly show that if the assumptions mentioned above are fulfilled separately the possibilities of success for the Czech teams are small. It is really important to combine these assumptions in one complex at the same time. There is not calculated with the influences we can not predict but may significantly affect the results in the competition . It is possible to estimate the success or failure of Czech teams in European team competitions from the result of this work.
