## Appendices

## Appendix 0: A link to a shared storage space on a drive

The quantitative test data, item analysis, outputs for statistical models, all tables and figures as well as transcribed qualitative data, preliminary questionnaire analyses, etc. can be accessed at:
https://drive.google.com/drive/folders/0Byuw22bnyFgQMFl4bE1TUWtJT0E

## Appendix 1: Quantitative data analysis PILOT

Appendix 1A:
PILOT: Test scores comparison
Compare means ( $\mathbf{t}$ test): PPT condition ( $\mathrm{M}=64.11, \mathrm{SD}=12.39$ ) vs CBT condition ( $\mathrm{M}=62.94, \mathrm{SD}=13.49$ ), $\mathrm{t}_{(137)}=1.06, \mathrm{p}=0.29$

Compare medians (Wilcoxon rank test, non-param): PPT condition (Median = $66, \mathrm{MAD}=14.83$ ) vs CBT condition (Median $=64.18, \mathrm{MAD}=14.28$ ), $\mathrm{V}=5443.5, \mathrm{p}=$ 0.17

The p values in both tests are above the standard alpha level (alpha < .05).

Appendix 1B:
PILOT: Test scores by mode of administration and gender

| Gender | Mode | N | Mean | SD | Median | Min | Max | Range |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Female | Computer-based | 88 | 63.8 | 13.9 | 64.8 | 25.2 | 90.5 | 65.4 |
| Female | Pencil \& paper | 88 | 64.3 | 12.6 | 65.5 | 33.0 | 89.0 | 56.0 |
| Male | Computer-based | 50 | 61.3 | 12.7 | 63.2 | 36.2 | 85.1 | 48.9 |
| Male | Pencil \& paper | 50 | 63.7 | 12.1 | 66.2 | 37.0 | 82.0 | 45.0 |

$\mathrm{N}=$ number of students, $\mathrm{SD}=$ standard deviation

Appendix 1C:

## Appendix 4: Qualitative Data Analysis

Appendix 4A
A list of themes and codes in alphabetical order:

| Theme | Code | Theme | Code |
| :---: | :---: | :---: | :---: |
| Attitude | A | No Pen | NP |
| Changing answers Cheating | $\begin{aligned} & \text { CA } \\ & \text { Ch } \end{aligned}$ | No problems with handwriting | NHW |
| Classroom | Cl | No Results | NR |
| Comfort | C | No Technology | NT |
| Computer fan | CF | Noise | Noi |
| Concentration | Con | Nothing | N |
| Content-related | C-r | Orientation | 0 |
| Difficulty | D | Performance-related | P-r |
| Environment | E | Physicality | Ph |
| Everything | Ev | Practical | P |
| Format | F | Resembles real life | RRL |
| Fun | Fu | Results | R |
| General | G | Scoring | Sc |
| Handwriting | HW | Screen | Scr |
| Layout | L | Spelling | Sp |
| Legibility | Le | Technology | Te |
| Less Comfortable | LC | Time | T |
| Log in | Log | Tradition | Tr |
| Manipulation | M | Typos | Ty |
| Mistakes | Mis | Writing | W |

Yellow themes were first identified in the students' responses concerning PPT advantages, blue themes were added for the PPT disadvantages, red themes emerged in the CBT advantages, and finally green themes in the CBT disadvantages. The themes are related in the analysis and not all of them appear in all the stages of the research.

Tick the mode of the test you have taken today:
COMPUTER BASED
PENCIL AND PAPER

One thing I liked about the test today:

One thing I didn't like about the test today:

Circle the answer which best describes your attitude: A/ I prefer the PENCIL AND PAPER form.
B/ I prefer the COMPUTER BASED form.
$\mathrm{C} / \mathrm{I}$ don't mind.

Other comments:

Thank you.

## Appendix 5: Statistical Model - Preferences

## Appendix 5A:

## RESULTS: Preferences STUDY 1

## Model: Destination subtest (mean subtest scores)

- The resulting model yielded an intercept of 13.2 ( $\mathrm{SE}=0.8$ ) - this represents the average score without the influence of testing mode or preference, i.e. in CBT mode for people who prefer the CBT mode of testing.
- $\quad$ The effect of testing mode was not significant (beta $=0.18, \mathrm{SE}=0.34, \mathrm{p}=0.59$ ). This would suggest no effect of testing mode (i.e. writing the test in the PPT mode did not affect the scores as opposed to writing it in the CBT).
- $\quad$ The effect of preference was not significant (beta $=0.01, \mathrm{SE}=0.74, \mathrm{p}=0.99$ and beta $=-0.9, \mathrm{SE}=0.59, \mathrm{p}=0.12$ for "no preference" and "preference for PPT", respectively) which suggests that preference in itself does not affect test scores (but these are test scores regardless of testing mode, so this is not surprising).
- The interaction between testing mode and preference was not significant (beta $=-0.68, \mathrm{SE}=0.6, \mathrm{p}=0.26$ and $\mathrm{beta}=0.22, \mathrm{SE}=0.47, \mathrm{p}=0.64$ for "no preference" and "preference for PPT", respectively).

## Model: Vocabulary subtest (mean subtest scores)

- The resulting model yielded an intercept of 15.2 (SE = 0.8) - this represents the average score without the influence of testing mode or preference, i.e. in the CBT mode for people who prefer the CBT mode of testing.
- The effect of testing mode was not significant (beta $=0.24, \mathrm{SE}=0.41, \mathrm{p}=0.55$ ). This would suggest no effect of testing mode (i.e. writing the test in the PPT mode did not affect the scores as opposed to writing it in the CBT mode).
- The effect of preference was not significant (beta $=-1.1, \mathrm{SE}=0.7, \mathrm{p}=0.11$ and beta $=-1, \mathrm{SE}=0.56, \mathrm{p}=0.05$ for "no preference" and "preference for PPT", respectively) which suggests that preference in itself does not affect test scores.
- The interaction between testing mode and preference was also not significant (beta $=0.44, \mathrm{SE}=0.71, \mathrm{p}=0.54$ and beta $=0.72, \mathrm{SE}=0.57, \mathrm{p}=0.2$ for "no preference" and "preference for PPT", respectively). This suggests no effect of preference on test scores.

Appendix 5B:

## RESULTS Preferences STUDY 2 <br> Model: Destination subtest (mean subtest scores)

- The resulting model yielded an intercept of 15.9 (SE = 0.8) - this represents the average score without the influence of testing mode or preference, i.e. in the CBT mode for people who prefer the CBT mode of testing.
- The effect of testing mode was not significant (beta $=-0.31, \mathrm{SE}=0.4, \mathrm{p}=0.44$ ). This would suggest no effect of testing mode.
- The effect of preference was not significant (beta $=0.98, \mathrm{SE}=0.95, \mathrm{p}=0.3$ and beta $=0.15, \mathrm{SE}=1.02, \mathrm{p}=0.88$ for "no preference" and "preference for PPT", respectively) which suggests that preference in itself does not affect test scores.
- The interaction between testing mode and preference was marginally significant (beta $=1.2, \mathrm{SE}=0.55, \mathrm{p}=0.032$ and beta $=1.23, \mathrm{SE}=0.59, \mathrm{p}=0.038$ for "no preference" and "preference for PPT", respectively). This suggests that people who have no preference or prefer the PPT mode of testing do slightly better when writing tests in the PPT mode, unlike those who prefer CBT. However, the alpha used here is 0.05 , which is rather lenient and would not survive the correction for multiple comparisons.

## Model: Vocabulary subtest (mean subtest scores)

- The resulting model yielded an intercept of 14.7 ( $\mathrm{SE}=0.8$ ) - this represents the average score without the influence of testing mode or preference, i.e. in the CBT mode for people who prefer the CBT mode of testing.
- $\quad$ The effect of testing mode was not significant (beta $=0.18, \mathrm{SE}=0.48, \mathrm{p}=0.7$ ). This would suggest no effect of testing mode.
- The effect of preference was not significant (beta $=1, \mathrm{SE}=1.02, \mathrm{p}=0.32$ and beta $=-0.92, \mathrm{SE}=1.1, \mathrm{p}=0.4$ for "no preference" and "preference for PPT", respectively) which suggests that preference in itself does not affect test scores.
- The interaction between testing mode and preference was also not significant (beta $=-0.21, \mathrm{SE}=0.66, \mathrm{p}=0.74$ and beta $=0.74, \mathrm{SE}=0.71, \mathrm{p}=0.297$ for "no preference" and "preference for PPT", respectively). This suggests no effect of preference on test scores.
